State Engineer of Utah,
Salt Lake City, Utah.

Dear Sir:

Two or three days ago I received the appointment you sent me as water commissioner for Long Valley in Kane Co., Utah.

In regard to the compensation it has been decided that I would serve for \$5.00 a day, it being understood that in a day I would be expected to go all up the valley and see that all the ditches were properly regulated. I must provide my own conveyance.

It was further estimated that one trip a week on the average during the months of June, July and August would be all that is necessary. That would allow me to earn about \$60.00 or \$65.00 during the season.

I would like to purchase some up to date instructions on how to build weirs and measure water in cubic feet per second.

The decree that fixes the shares of water on this stream makes no mention of second feet measurements so I assume that it is possible to measure and divide the water according to shares without reducing it to second feet. However I would like to become familiar with second feet calculations so I can use them if necessary.

Yours truly,

Birt Gardner
